.tptp

- ▶ Is a language⁴ to encode problems (Sutcliffe, 2009)
- ▶ Is the input of the ATPs
- ▶ Annotated formulas with the form

```
language(name, role, formula).
```

language FOF or CNF

name to identify the formula within the problem

role axiom, definition, hypothesis, conjecture

formula version in TPTP format

⁴<http://www.cs.miami.edu/~tptp/TPTP/SyntaxBNF.html>

► $p \vdash p$

```
fof(a, axiom, p).  
fof(goal, conjecture, p).
```

► $\vdash \neg(p \wedge \neg p) \vee (q \wedge \neg q)$

```
fof(goal, conjecture, ~ ((p & ~ p) | (q & ~ q))).
```

Metis is an automatic theorem prover for First-Order Logic with Equality (Hurd, 2003)

Why Metis?

- ▶ Open source implemented in Standard ML
- ▶ Each refutation step is one of *six rules*
- ▶ Reads problem in TPTP format
- ▶ Outputs detailed proofs in TSTP format

⁵<http://www.gilith.com/software/metis/>

TSTP derivations by Metis exhibit these inferences⁶

Rule	Purpose
canonicalize	transforms formulas to CNF, DNF or NNF
clausify	performs clausification
conjunct	takes a formula from a conjunction
negate	applies negation to the formula
resolve	applies theorems of resolution
simplify	applies over a list of formula to simplify them
strip	splits a formula into subgoals

⁶Inference rules found in proofs of Propositional Logic theorems

.tstp

A TSTP derivation⁷

- ▶ Is a **Directed Acyclic Graph** where
 - leaf** is a formula from the TPTP input
 - node** is a formula inferred from parent formula
 - root** the final derived formula
- ▶ Is a list of annotated formulas with the form

```
language(name, role, formula, source [,useful info]).
```

where **source** typically is an inference record

```
inference(rule, useful info, parents)
```

⁷<http://www.cs.miami.edu/~tptp/TPTP/QuickGuide/Derivations.html>

- Proof found by Metis Prover for the problem $p \vdash p$

```
$ metis --show proof problem.tptp
fof(a, axiom, p).
fof(goal, conjecture, p).
fof(subgoal_0, plain, p),
    inference(strip, [], [goal])).
fof(negate_0_0, plain, ~ p,
    inference(negate, [], [subgoal_0])).
fof(normalize_0_0, plain, ~ p,
    inference(canonicalize, [], [negate_0_0])).
fof(normalize_0_1, plain, p,
    inference(canonicalize, [], [a])).
fof(normalize_0_2, plain, $false,
    inference(simplify, [],
        [normalize_0_0, normalize_0_1])).
cnf(refute_0_0, plain, $false,
    inference(canonicalize, [], [normalize_0_2])).
```

By refutation, we proved $p \vdash p$:

$$\begin{array}{c}
 \frac{p}{p} \text{ assume} \\
 \frac{p}{p} \text{ strip} \\
 \frac{p}{\neg p} \text{ negate} \qquad \frac{p}{p} \text{ canonicalize} \\
 \hline
 \frac{\neg p \quad p}{\perp} \text{ simplify} \\
 \frac{\perp}{\perp} \text{ canonicalize}
 \end{array}$$

Is a Haskell program that translates proofs given by Metis Prover in TSTP format to Agda code

- ▶ Parsing of TSTP language^{8,9}
- ▶ Creation⁸ and analysis of **DAG** derivations
- ▶ Analysis of inference rules used in the TSTP derivation
- ▶ Agda code generation

Library	Purpose
Agda-Prop	axioms and theorems of Classical Propositional Logic
Agda-Metis	versions of the inference rules used by Metis

⁸<https://github.com/agomezl/tstp2agda>

⁹<https://github.com/jonaprieto/tstp2agda>

¹⁰<http://github.com/jonaprieto/athena>

- ▶ Intuitionistic Propositional Logic + PEM ($\Gamma \vdash \phi \vee \neg \phi$)
- ▶ A data type for formulas

```
data Prop : Set where
  Var    : Fin n → Prop           -- Variables.
  T      : Prop                   -- Top (truth).
  ⊥      : Prop                   -- Bottom (falsum).
  _∧_    : (φ ψ : Prop) → Prop   -- Conjunction.
  _∨_    : (φ ψ : Prop) → Prop   -- Disjunction.
  _⇒_    : (φ ψ : Prop) → Prop   -- Implication.
  _⇔_    : (φ ψ : Prop) → Prop   -- Biimplication.
  ¬_     : (φ : Prop) → Prop      -- Negation.
```

¹¹<https://github.com/jonaprieto/agda-prop>

- ▶ A data type for theorems

```
data _⊢_ : (Γ : Ctxt) (φ : Prop) → Set
```

- ▶ Constructors

```
assume, axiom, weaken, ⊤-intro, ⊥-elim, ¬-intro,
¬-elim, ∧-intro, ∧-proj1, ∧-proj2, ∨-intro1,
∨-intro2, ∨-elim, ⇒-intro, ⇒-elim, ⇔-intro,
⇔-elim1, ⇔-elim2.
```

- ▶ Natural deduction proofs for more than 71 theorems

```
⇔-equiv, ⇔-assoc, ⇔-comm, ⇒-⇔-¬∨, ⇔-¬-to-¬,
¬⇔-to-¬, ¬¬-equiv, ⇒-⇔-∧⇒, ⇔-trans, ∧-assoc,
∧-comm, ∧-dist, ¬∧-to-¬∨, ¬∨¬-to-¬∧, ¬∨¬-⇔-¬∧,
subst⊢∧1, subst⊢∧2, ∨-assoc, ∨-comm, ∨-dist,
∨-equiv, ¬∨-to-¬∧, ¬∧¬-to-¬∨, ∨-dmorgan,
¬∨¬¬-to-∨, cnf, nnf, dnf, RAA, ...
```

¹²<https://github.com/jonaprieto/agda-prop>

Rule	Purpose	Theorem
<code>canonicalize</code>	transforms formulas to CNF, DNF or NNF	<code>atp-canonicalize</code>
<code>clausify</code>	performs clausification	<code>atp-clausify</code>
<code>conjunct</code>	takes a formula from a conjunction	<code>atp-conjunct</code>
<code>negate</code>	applies negation to the formula	<code>atp-negate</code>
<code>resolve</code>	applies theorems of resolution	<code>atp-resolve</code>
<code>simplify</code>	applies over a list of formula to simplify them	<code>atp-simplify</code>
<code>strip</code>	splits a formula into subgoals	<code>atp-strip</code>

¹³<https://github.com/jonaprieto/agda-metis>

► Definition

$$\text{conjunct}(\phi_1 \wedge \phi_2 \wedge \cdots \wedge \phi_i \wedge \cdots \wedge \phi_n, \phi_i) \longrightarrow \phi_i$$

► Function¹⁴:

```
conjunct : Prop → Prop → Prop
conjunct (φ ∧ ψ) ω with [ eq φ ω ] | [ eq ψ ω ]
... | true   |      = φ
... | false  | true  = ψ
... | false  | false = conjunct φ ω
conjunct φ ω      = φ
```

► Theorem¹⁴

```
atp-conjunct
  : ∀ {Γ} {φ}
  → (ω : Prop)
  → Γ ⊢ φ
  → Γ ⊢ conjunct φ ω
```

¹⁴Excerpt from the Agda-Metis library available in `ATP.Metis.Rules.Conjunct` module

¹⁵<https://github.com/jonaprieto/agda-metis>

```
atp-conjunct
  :  $\forall \{\Gamma\} \{\varphi\}$ 
   $\rightarrow (\omega : \text{Prop})$ 
   $\rightarrow \Gamma \vdash \varphi$ 
   $\rightarrow \Gamma \vdash \text{conjunct } \varphi \ \omega$ 

atp-conjunct  $\{\Gamma\} \{\varphi \wedge \psi\} \ \omega \ \Gamma \vdash \varphi$ 
  with | eq  $\varphi \ \omega$  | | eq  $\psi \ \omega$  |
